

- Remove the hard drives from your DiskStation and connect them to your computer. For RAID or SHR configurations, you'll have to connect all the hard drives (excluding hard drives used as hot spares) to your computer at the same time.

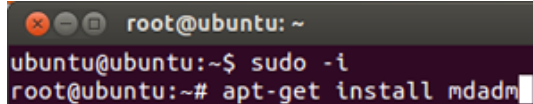

Note: Please make sure the file system running on the hard drives of your Synology NAS are EXT4 or Btrfs.

- Visit <http://www.ubuntu.com/download/desktop> to download the Ubuntu ISO file.

- Burn the ISO on a blank DVD and use it to boot your computer.
- Install Ubuntu on an empty hard drive or USB stick.
- If you're recovering files from a RAID or SHR configuration, please see steps 7 to 11. For recovering files from basic storage types with only one hard drive, please skip to step 12.
- Go to **Applications** and open **Terminal**.

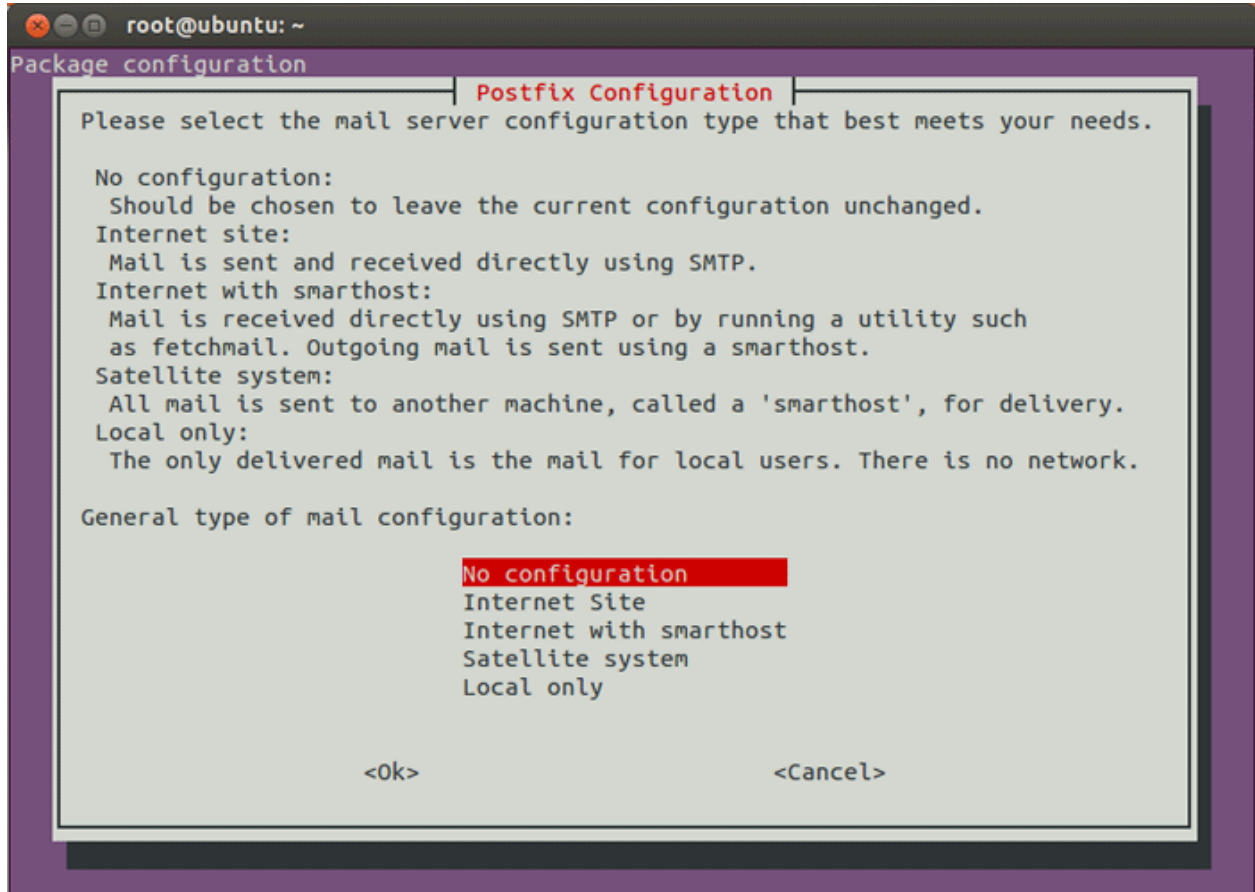

8. Install **mdadm** with the following commands.

```
Ubuntu@ubuntu:~$ sudo -i
root@ubuntu:~$ apt-get install mdadm
```

```
root@ubuntu: ~
ubuntu@ubuntu:~$ sudo -i
root@ubuntu:~# apt-get install mdadm
```

9. Select **No configuration** and complete the installation.

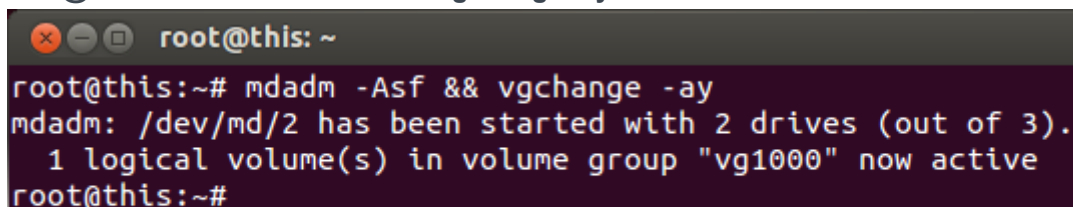

10. Install **lvm2** with the following commands.

```
root@ubuntu:~$ apt-get install lvm2 (otherwise vgchange won't work)
```

11. Run the following command to mount all of the hard drives from your DiskStation.

```
root@ubuntu:~$ mdadm -Asf && vgchange -ay
```

```
root@this: ~
root@this:~# mdadm -Asf && vgchange -ay
mdadm: /dev/md/2 has been started with 2 drives (out of 3).
  1 logical volume(s) in volume group "vg1000" now active
root@this:~#
```

12. Now you'll be able to browse all the shares and files on the hard drives. You may also connect a USB drive to the PC, copy required files to the USB drive, and then transfer the files to other devices.
